Do a disease's strongest cell types sit in its own organ?

Atlas: hpa700. Rows: diseases by primary organ (a disease counts in each of its primary organs). Columns: tissue of the cell type. Outlined cells = same organ.

Mean-rank test: a disease's own-organ cell types rank at AUC 0.50 vs 0.50 for shuffled organ labels (p = 0.60, 191 diseases); per organ at right.
Focal test: 11.4% of each disease's top 10 cell types are in its own organ vs 5.8% with shuffled organ labels (p = 0.0005).
