Do a disease's strongest cell types sit in its own organ?

Atlas: pp229. Rows: diseases by primary organ (a disease counts in each of its primary organs). Columns: tissue of the cell type. Outlined cells = same organ.

Mean-rank test: a disease's own-organ cell types rank at AUC 0.50 vs 0.51 for shuffled organ labels (p = 0.81, 184 diseases); per organ at right.
Focal test: 7.9% of each disease's top 10 cell types are in its own organ vs 5.4% with shuffled organ labels (p = 0.0010).
