Which organ is each disease expected to affect?

50 representative diseases (covering 83 of the 191 evaluated), grouped by organ system. Near-duplicate diseases (same primary organs, overlapping ICD-10 codes) are merged; each row is the most typical of its group and '×n' says how many diseases it stands for. Dot colour = the organ's system. An organ is primary when ≥25% of the disease's organ-bearing ICD-10 categories point to it.
* = medium confidence: the Atlas chapter cannot corroborate the organ (infections, neoplasms and endocrine/metabolic diseases span many organs; depression is filed under 'Endocrine'), so it rests on the ICD-10 block table alone.
