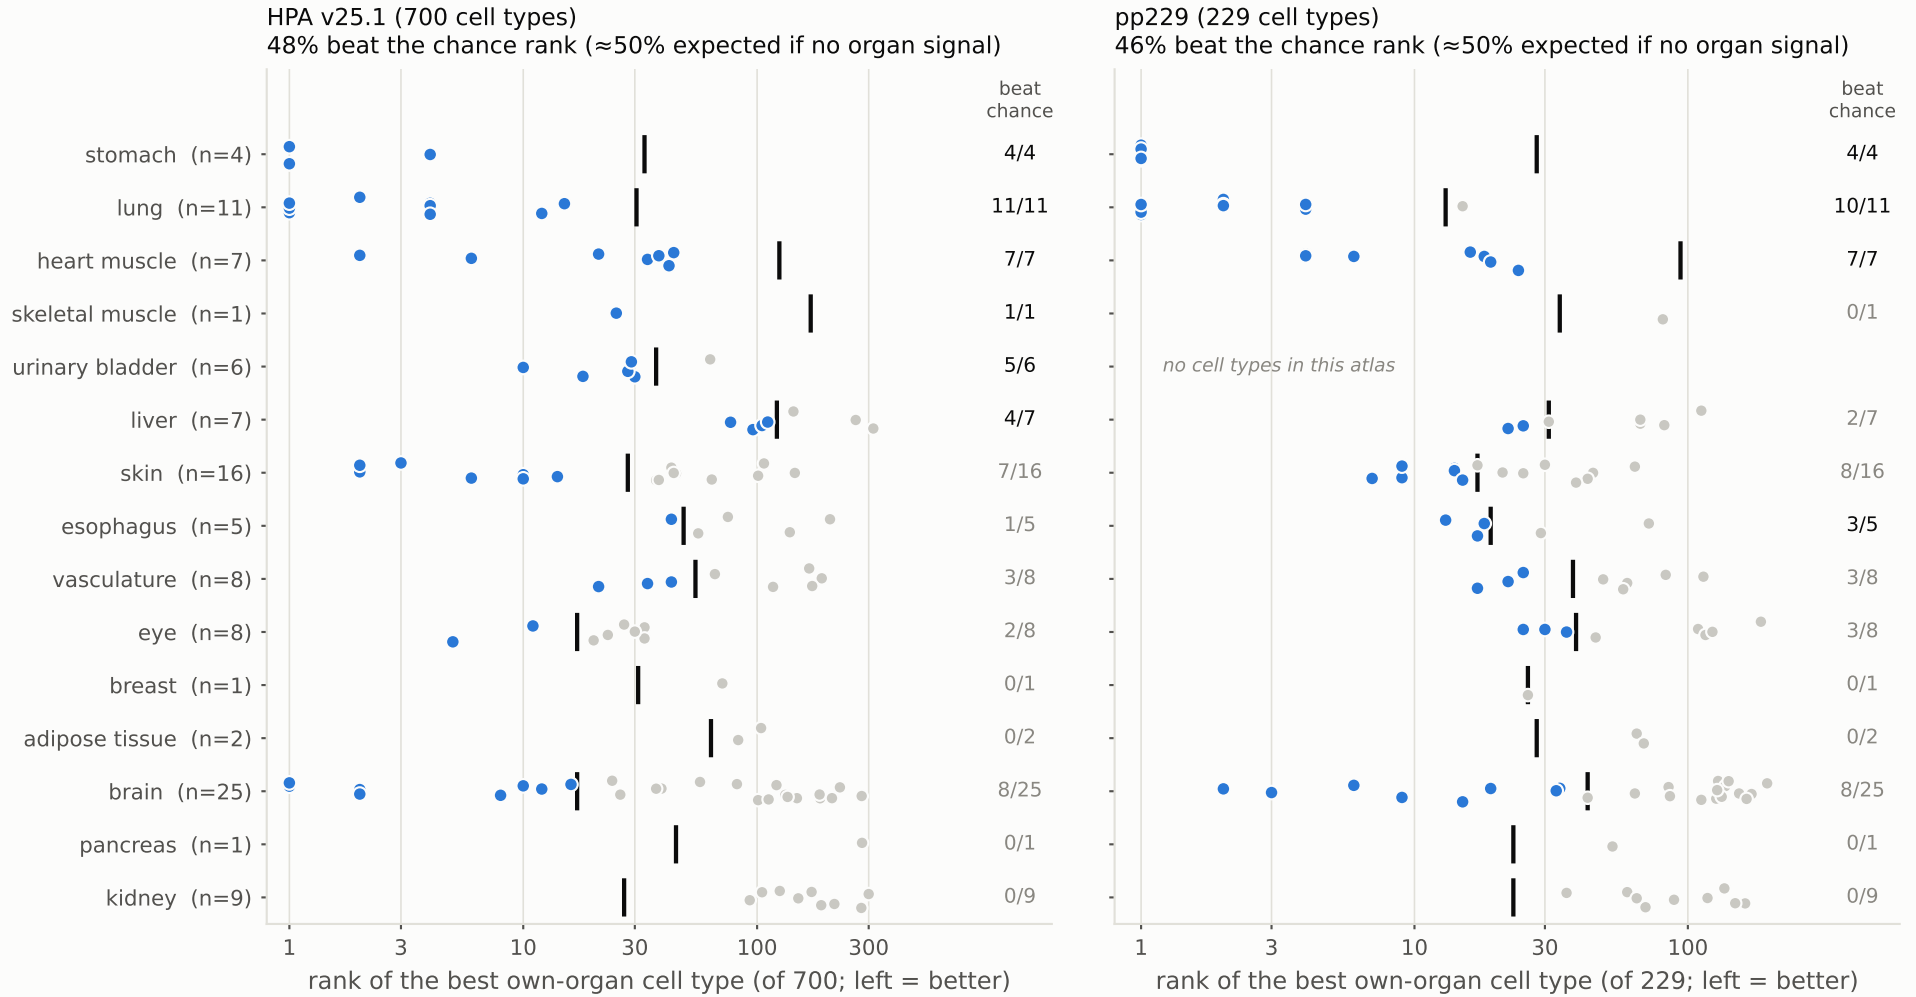
Per disease: where does its best own-organ cell type rank?


One dot per single-organ disease. Black tick = the organ's chance rank: the MEDIAN rank of that organ's best cell type across all diseases that do not have it as an organ.
Blue = this disease ranks its own organ better (further left) than that median; gray = worse. A disease with no organ information would land left of the tick about half the time.
Organs sorted by median distance from chance, both atlases.
